"Navajo" Zinnias FREE

To every customer this year, we are giving, FREE, one packet of seeds of this wonderful Zinnia. The bicolor effect of each petal, being heavily tipped a lighter color than the balance of the flower, is most attractive and reminds one of the lovely colorings to be found in a Navajo rug.

Maule's Selection of the Very Best

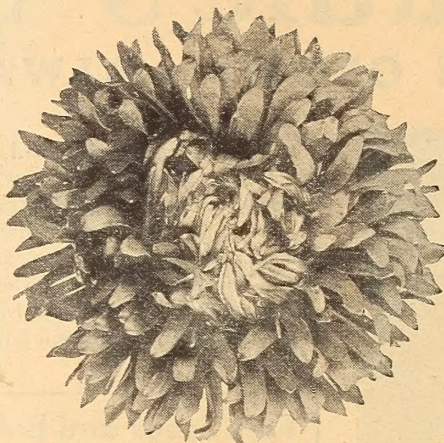

New Dwarf Erect Verbena, Blue Sentinel

1977 Verbena, Blue Sentinel

Plants are dwarf, compact and perfectly erect in growth, 10 in. high and 20 in. wide. Each upright spike bears an attractive head of rich, royal violet-blue flowers; these individual flowers grow $\frac{3}{4}$ in. across and make up into well-formed clusters about 2 in. across. Ideal for beds, borders and edgings.

Pkt. 25c; 2 pkts. 45c; 5 pkts. \$1.00.

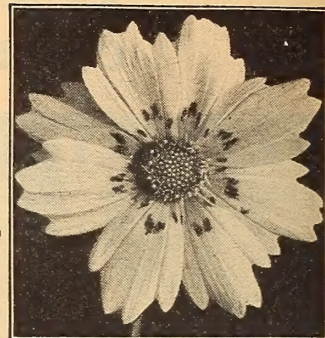

Extra Early Aster, Violet Glory

1058 Aster, Violet Glory

Extremely early blooming; first flowers appear in about 14 weeks after the seed is sown. They are of a rich shade of deep purple-violet, 3 to $3\frac{1}{2}$ in. across, fully double and so thick as to be almost globular. The incurved center petals display a handsome silvery sheen. Plants grow $1\frac{1}{2}$ ft. tall and are of open, spreading habit, about 2 ft. across. Stems are straight, strong and range from 12 to 15 in. in length. Extreme earliness and remarkable cutting stems make Violet Glory a most desirable Aster.

Pkt. 25c; 2 pkts. 45c; 5 pkts. \$1.00.

Calliopsis Coronata

1189 Calliopsis Coronata

The earliest of all Calliopsis; blooms in 12 weeks from the time the seed is sown. Flowers are bright golden yellow, attractively marked with a ring of delicate maroon penciling about $\frac{1}{2}$ in. from the center disc. Between the penciling, and the center, the color becomes golden orange. The flowers grow 2 to $2\frac{1}{2}$ in. across and are borne on long, clean stems 12 to 15 in. long. Fine for cutting and showy in beds or borders.

Pkt. 15c; $\frac{1}{4}$ oz. 35c; $\frac{1}{2}$ oz. 60c.

Spanish Gold Marigold

Four New Marigolds

1485 Spanish Gold

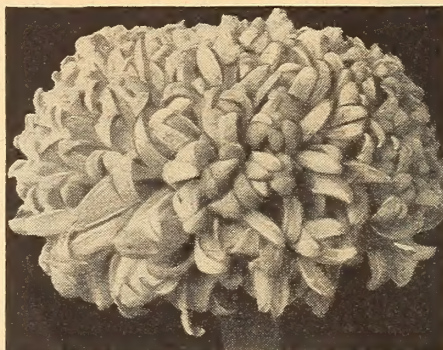

Unlike any Marigold ever offered before. Called Hedge or Border type; so uniform are the plants in growth that a row looks like a nicely trimmed hedge about 20 in. high and 30 in. wide. Besides its usefulness as a hedge, it is really fine for all purposes—borders, beds and as a cut flower. Flowers are most artistic; they somewhat resemble Carnations but are more waved and frilled; fully double, 3 in. across, and of a deep glowing golden orange. Blooms in 20 weeks from seed and will keep on blooming until killed by frost.

Pkt. 25c; 2 pkts. 45c; 5 pkts. \$1.00.

1476 Early Sunshine

Bright lemon-yellow flowers composed of many curled and interlaced florets which gives them the appearance of a Pompon Chrysanthemum. They grow $2\frac{1}{2}$ in. across and $1\frac{1}{2}$ in. deep. Plants grow 2 ft. tall and bloom extremely early, in fact, first flowers are to be had in 15 weeks after the seed is sown; they continue to bear for a long time. Showy in the garden and highly prized for cutting.

Pkt. 25c; $\frac{1}{8}$ oz. \$1.00.

Early Sunshine Marigold

1480 Burpee Gold

A wonderful Carnation-flowered Marigold with *odorless foliage*. Earlier blooming, larger flowered, dwarfier growing and produces more flowers than Guinea Gold and, best of all, the foliage is entirely free of the usual Marigold odor. Flowers are deep orange, $3\frac{1}{2}$ in. across, and freely produced on plants $2\frac{1}{2}$ ft. tall. Begin to bloom in 15 weeks; continues until frost.

Pkt. 15c; $\frac{1}{8}$ oz. 40c; $\frac{1}{4}$ oz. 70c.

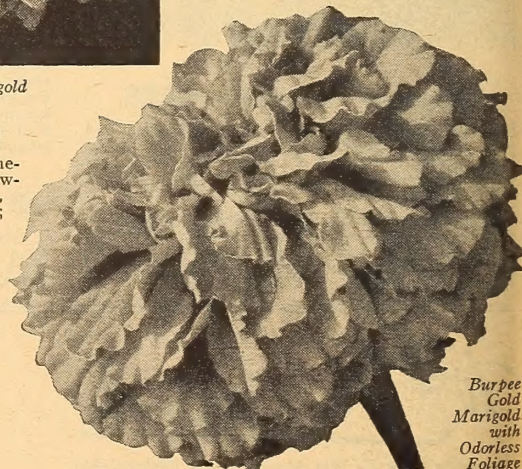

1479 Golden Glow

Entirely distinct flower form, somewhat like the Chrysanthemum-flowered type but petals are straight, sharply pointed and lie rather flat; they resemble in appearance, as well as color, the familiar Golden Glow Rudbeckia, hence the name. Flowers are bright, sharp golden yellow, $2\frac{1}{2}$ in. across and are borne in clusters of 5 to 10 on the ends of long branches. Golden Glow is highly prized for cutting as *foliage is entirely odorless*. Plants grow 2 ft. tall and begin to bloom in 17 weeks from seed.

Pkt. 25c; 2 pkts. 45c; 5 pkts. \$1.00.

Pkt. 25c; 2 pkts. 45c; 5 pkts. \$1.00.

1353 Annual Delphinium

Pkt. 20c; $\frac{1}{8}$ oz. 60c.

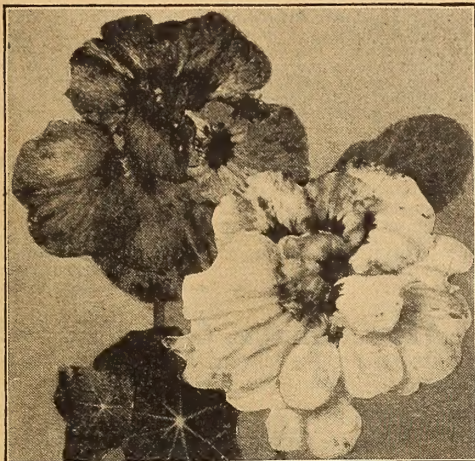

1583 Petunia, Strawberry Festival

The new Strawberry Festival Petunia is different; not only are its flowers unusual but also its habit of growth. As a cut flower it is one of the best for its exceptionally strong, sturdy stems, covered with small, firm, round leaves, bear several open flowers at a time. These medium-sized flowers, 2 to 3 in. across, are of a firm texture, and in color are about half-way between old rose and crushed strawberry. The whole flower attracts attention. The dark plum colored center is deep and broad giving the flower a decided Gloxinia appearance. As easy to grow as any other bedding Petunia.

Scabiosa, Pompadour

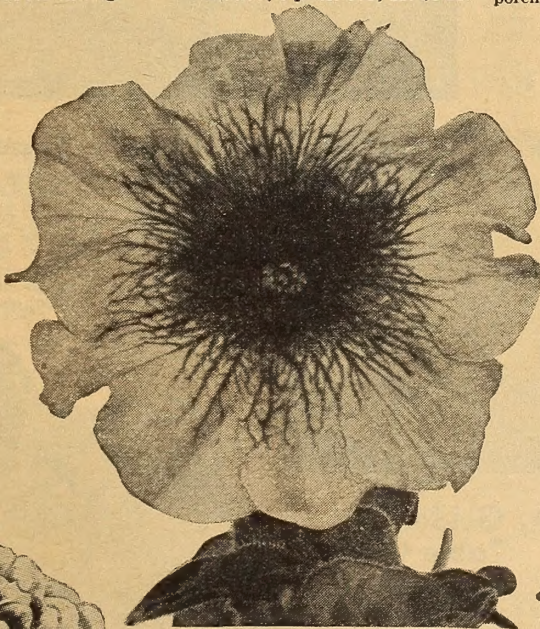

Nasturtium, Tiger Flowered Mixed

1544 Nasturtium, Tiger Flowered Mixed

An unusual, but striking mixture of large, semi-double flowers of the semi-tall or Glean type. Flowers are of many bizarre markings, streaked or mottled in various degrees. Sometimes, these markings are confined to the throat while on others the whole surface is blotched or mottled with deep colors on a lighter ground, very often changing considerably in different flowers on the same plant. Flowers are very large, exquisitely sweet-scented and freely borne on semi-tall plants, some with light green and others with deep bluish-green foliage. Splendid for beds, wide borders, ground covers, as well as for cutting.

THE BEST OF THE NEW

11 Bush Bean, The Commodore

(52 days) An All-America Prize Winner—1937 This remarkable bean which is frequently called a dwarf Kentucky Wonder, is already enjoying great popularity even though seed is still quite scarce. The unusually long pods, 7 to 9 in., are very similar to those of Kentucky Wonder, both in form and quality. They are nearly round, very fleshy, tender and free from strings at all stages of growth. Due to the large size of the pods, and the profusion in which they are produced, this bean is an extremely heavy yielder and it appears to be well adapted to varying growing conditions.

Pkt. 15c; ½ lb. 35c; 1 lb. 65c; 2 lbs. \$1.25; 5 lbs. \$3.05.

646 Squash, Connecticut Straightneck

(55 days) An improved and very uniform straightneck summer squash developed by Dr. L. C. Curtis at the Connecticut Experiment Station. The plants, which are of the true bush type, are very prolific. Fruits are from 7 to 9 in. long and have the shape of regular strains of Straightneck Summer but are smoother and have a less definite neck. Both seeds and seed cavity are small. Present indications are that Connecticut Straightneck will soon take the place of all earlier strains both on the market and in the home garden.

Pkt. 10c; oz. 20c; ¼ lb. 50c; ½ lb. 75c; 1 lb. \$1.25; 2 lbs. \$2.30; 5 lbs. \$5.50.

126 Cabbage, Cornell Early Savoy

(75 days) This is the "Odorless Cabbage" which has received so much publicity during the past two years. Dr. C. H. Myers of Cornell University, who developed this variety, does not claim it to be entirely odorless but it has decidedly less odor than other cabbages. Heads are of medium size, slightly pointed, light green and of the Savoy or crumpled leaved type.

Pkt. 15c; ½ oz. 55c; oz. \$1.00; ¼ lb. \$3.00.

723 Tomato, Italian Canner

(110 days) A distinct type of tomato. Ideal for all canning use. This Tomato is probably most familiar in the form of canned tomato paste, used as sauce for spaghetti. Fruits are oblong, roughly pear-shaped, 1 in. in diameter and 2 in. long, brilliant red, with a tough skin, little juice and low acid content. They will remain on the vine in good condition for a long time. You'll be pleased with the beautiful color and fine flavor of catsup, chili or spaghetti sauce, and canned tomatoes from this variety.

Pkt. 10c; ½ oz. 20c; oz. 35c; ¼ lb. 95c; ½ lb. \$1.50; 1 lb. \$2.75.

705 Tomato, Super Marglobe

(105 days) A truly outstanding tomato which is the result of many years of selection work in the original strain of Marglobe. The object of this work was to produce a larger fruited tomato that would retain the many desirable qualities of the parent plants. We feel that this work has been completely successful as Super Marglobe bears fruits having all of the smoothness, uniformity, and fine flavor of Marglobe but which average at least 1 oz. heavier. The plants are vigorous and heavy but rather compact; they are also highly resistant to disease and unfavorable growing conditions.

Pkt. 15c; ½ oz. 30c; oz. 45c; ¼ lb. \$1.25; ½ lb. \$2.35; 1 lb. \$4.25.

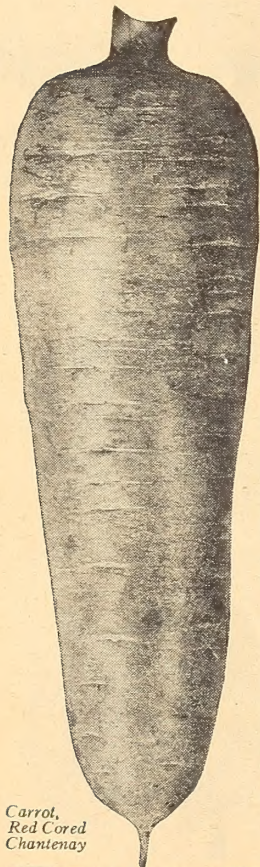

Bush Bean, The Commodore

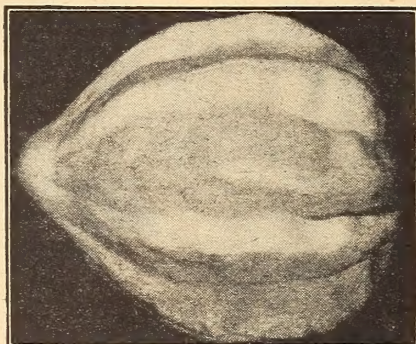

158 Carrot, Supreme Half Long

(75 days) In appearance, this carrot is very much like a fine strain of Danvers except that the roots are longer and the shoulders are smaller. The interior color is its outstanding feature, being uniformly deep orange-red. The core is small and of the same color as the outer portion. Tops are short and sturdy; just right for bunching.

Pkt. 10c; oz. 20c; ¼ lb. 55c; ½ lb. 85c; 1 lb. \$1.45; 2 lbs. \$2.65; 5 lbs. \$6.40.

Red Cored
Chantenay

Squash, Golden Table Queen

649 Squash, Golden Table Queen

(58 days) A beautiful golden-yellow variety of the popular Table Queen type. Can be used as a summer squash while young or for baking when fully matured. Although this squash is now very popular, it deserves a much wider use. If you grow it once, you will want it in your garden every year.

Pkt. 10c; oz. 20c; ¼ lb. 50c; ½ lb. 75c; 1 lb. \$1.30; 2 lbs. \$2.40; 5 lbs. \$5.70.

157 Carrot, Red Cored Chantenay

(70 days) This carrot is very similar to the regular Chantenay except for its dark and uniform color and indistinct core. Chantenay has been a favorite with home and commercial growers for many years. This red cored type is a distinct improvement and is certain to be even more popular. The roots are uniform in size and shape and about 4½ to 5 in. long and 1¼ in. in diameter at the shoulder. They are smooth and decidedly stump rooted.

Pkt. 10c; oz. 15c; ¼ lb. 40c; ½ lb. 60c; 1 lb. \$1.00; 2 lbs. \$1.85; 5 lbs. \$4.40.

VEGETABLES FOR 1939

508 Sugar Pea, Giant Butter

(72 days) An entirely new type of edible podded pea. The long, curved, semi-round pods are very meaty and free from fiber or toughness. The pod is edible until the peas are fully formed and can therefore be used at almost any stage of growth. Vines are sturdy and grow from 4 to 5 ft. tall. Support of string or brush should be provided for best results.

Pkt. 20c; ½ lb. 70c; 1b. \$1.25.

500 Pea, Mammoth Podded Extra Early

(56 days) An improved type of early, smooth seeded pea. The large pods, 4 in. in length, are well filled with large peas of fine quality. A heavy yielder and well adapted for home or market growing. Vines 30 to 36 in. tall.

Pkt. 15c; ½ lb. 25c; 1b. 45c; 2 lbs. 80c; 5 lbs. \$1.50;

10 lbs. \$2.80, postpaid.

Not prepaid: 15 lbs. \$3.30;

25 lbs. \$5.25; 50 lbs. \$10.00;

100 lbs. \$19.00.

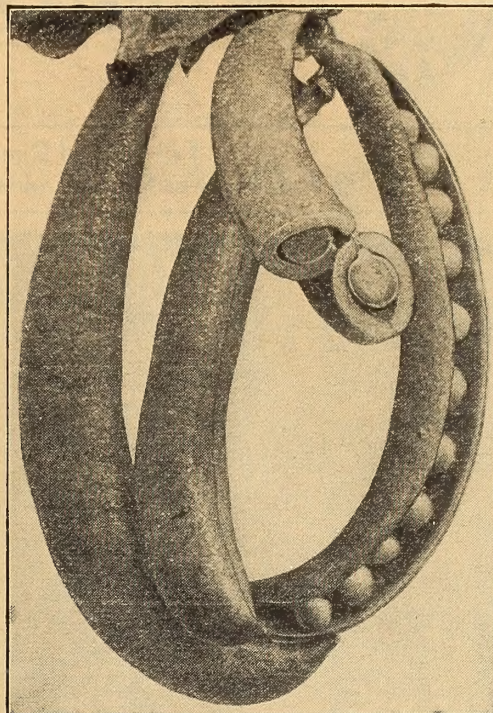

137 Cabbage, Jumbo

(120 days) An extremely large headed cabbage that is unsurpassed for fall or winter use. Heads are flattened, very solid and frequently weigh 30 lbs. when grown under good conditions. A fine keeper and excellent for kraut.

Pkt. 10c; oz. 35c;

¼ lb. \$1.00; ½ lb. \$1.65;

1b. \$3.00.

Sugar Pea, Giant Butter

618 Spinach, Summer Savoy

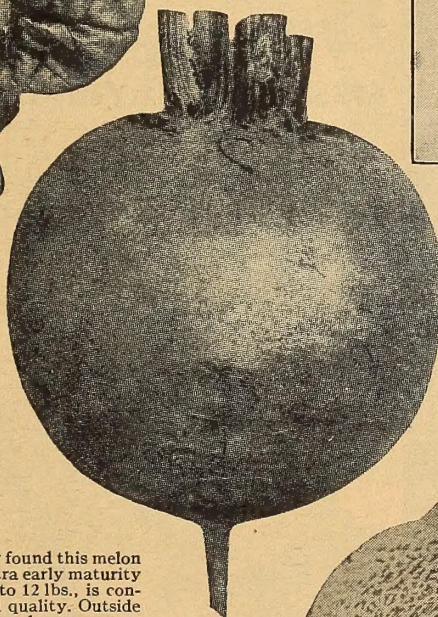

(52 days) A recent selection of the Bloomsdale type remarkable for its ability to stand without forming seed stalks. Plants very low growing, heavily savoyed, with very thick, dark green leaves. It is slightly smaller than Long Standing Bloomsdale, and the strain which we are listing has stood at least a week longer than any other strain of the savoy leaved type. Recommended for late summer use and for either home or market gardens.

Pkt. 10c; oz. 15c; ¼ lb. 25c; ½ lb. 35c; 1b. 55c; 2 lbs. \$1.00; 5 lbs. \$2.20; 10 lbs. \$4.10.

390 Watermelon, Early Northern Sweet

(80 days) Growers in Northern localities have already found this melon to be well adapted to their growing conditions. The extra early maturity makes it ideal for short growing seasons. The size, 8 to 12 lbs., is convenient for home or market. Flesh is red and of good quality. Outside color is dark green with a faint striping. If you have found your seasons to be too short for melon growing in the past, we suggest that you try Early Northern Sweet.

Pkt. 10c; oz. 15c; ¼ lb. 45c; ½ lb. 65c; 1b. \$1.10; 2 lbs. \$2.00; 5 lbs. \$4.80.

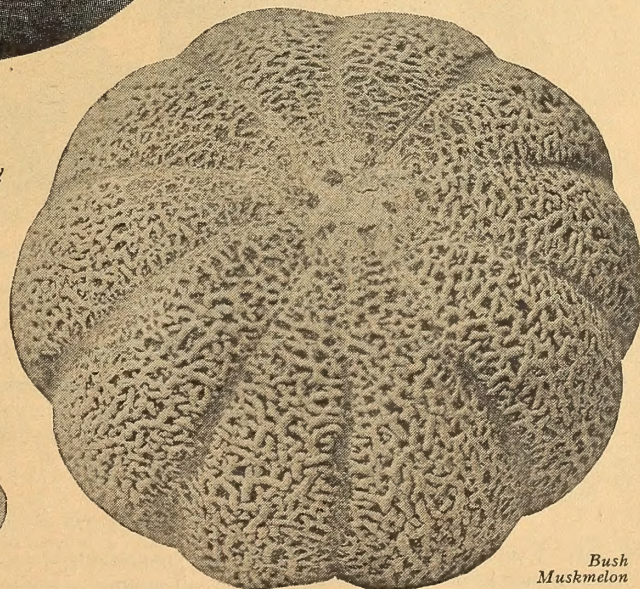

Beet, Early Red Chief

71 Beet, Early Red Chief

(55 days) A really outstanding NEW variety that is certain to prove popular. Roots are globe shaped, of large size and early maturity. Interior color is a fine deep red with a minimum of zoning. Tops are medium sized and fine for bunching and the smooth, shapely roots make a very attractive display. We would like to urge all growers who are interested in securing improved varieties to arrange for at least a trial planting of this excellent beet.

Pkt. 15c; oz. 20c; ¼ lb. 50c; ½ lb. 75c; 1b. \$1.30; 2 lbs. \$2.40; 5 lbs. \$5.70.

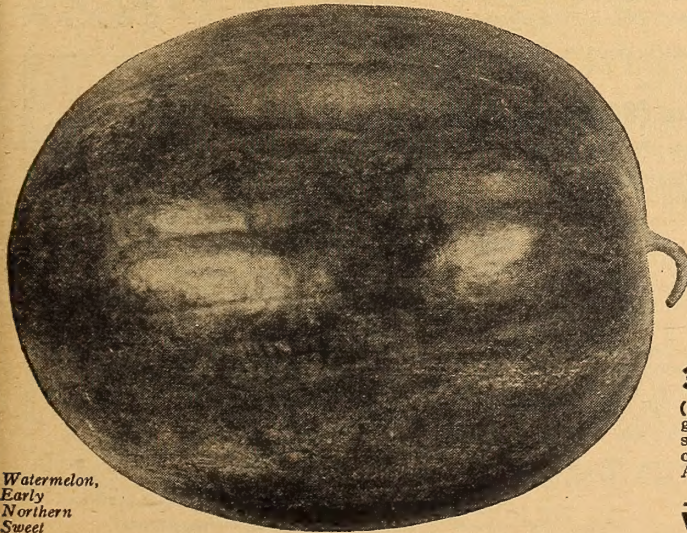

Bush Muskmelon

352 Bush Muskmelon

The use of varieties such as Bush Muskmelon will help to overcome this difficulty. Plants are compact and occupy a small space. Fruits are green fleshed and of good quality. Average weight 1 lb.

Pkt. 10c; oz. 25c; ¼ lb. 75c; ½ lb. \$1.15; 1b. \$2.00.

Mary Washington Rust-Resistant Asparagus

Broccoli

Culture: Same as for Cabbage. Italian or Sprouting Broccoli very much resembles a Cauliflower except in color. One large head is borne on the main stalk and, when cut, a succession of smaller heads appear, which if kept cut will be replaced by others for 2 months or more. St. Valentine is a white headed variety, similar to Cauliflower and entirely different from the green Italian or Sprouting varieties. A packet will produce about 250 plants; an ounce, 3,000 plants; use $\frac{1}{4}$ lb. for an acre.

105 Calabrese (90 days) ✱

Large Green Sprouting Heads; Italian

Most delicious "green" vegetable which has become extremely popular because of its delicate flavor. Forms large, rich green sprouting heads, which, if kept cut, will continue to develop smaller heads for 8 or 10 weeks, thereby providing a continuous supply of "greens" for a long time.

Pkt. 10c; $\frac{1}{2}$ oz. 20c; oz. 35c; $\frac{1}{4}$ lb. \$1.00;
 $\frac{1}{2}$ lb. \$1.65; lb. \$3.00.

103 St. Valentine (150 days)

Also Known as Winter Cauliflower

White heading type of Broccoli grown in the northwest for shipment to the eastern markets. It looks very much like Cauliflower, but is more hardy and requires much more time to mature. Very productive; the large, solid white heads are of the choicest quality. Needs a warm climate and long growing season.

Pkt. 10c; $\frac{1}{2}$ oz. 25c; oz. 45c; $\frac{1}{4}$ lb. \$1.30;
 $\frac{1}{2}$ lb. \$2.40; lb. \$4.35.

Asparagus

Culture: Sow seed in early spring in rows $1\frac{1}{2}$ to 2 ft. apart, spacing the seed 1 in. apart in the row, and firmly cover with 1 in. of fine soil. Keep free from weeds at all times. A packet will produce about 200 roots; ounce, 750; 4 to 5 lbs. to the acre.

Mary Washington (Rust-Resistant)

The Finest and Most Vigorous Green Asparagus

Mary Washington has replaced all other varieties of Asparagus because the shoots are larger, thicker, more uniform, and practically immune to "rust" and other diseases. Of a delicious flavor, tender, and an attractive dark green color. The tips or buds grow straight, are tightly folded, and grow quite tall without branching. Makes a quick growth.

4 Seed Seeds sown this spring will produce tips of cutting size the third year. Pkt. 10c; oz. 15c; $\frac{1}{4}$ lb. 40c;
 $\frac{1}{2}$ lb. 60c; lb. 95c; 2 lbs. \$1.70; 5 lbs. \$4.05.

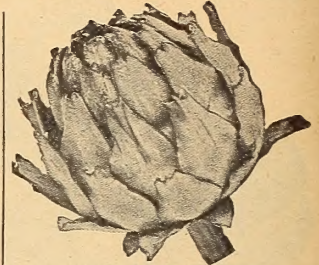

69B56 Roots (1 Year Old)

Planting our strong, healthy roots this spring saves a year over raising your own plants from seed. Some cutting may be done next spring, but better to wait until the second year. 25 for 70c; 50 for \$1.20; 100 for \$2.00, prepaid. Not prepaid: 1000 for \$9.50; 5000 for \$43.00.

69B58 Roots (2 Year Old)

We recommend this size if quick returns are wanted. Set out early this spring, a small cutting can be made during the coming season.

Artichoke, Green Globe

Artichoke

2 Green Globe

Grown extensively for its edible, deep green, globe-shaped buds or flower heads whose fleshy bud scales, when cooked, are regarded as a choice delicacy. Sow seed early indoors, setting the plants outdoors after danger of frost is past, 2 ft. apart in rows 4 ft. apart. Plants are hardy, but where winters are severe, protect with a heavy mulch to keep crowns from freezing. Will produce a crop of buds the second season and yield heaviest during the first two or three years. A packet will produce 25 plants; an ounce about 500.

Pkt. 10c; $\frac{1}{2}$ oz. 25c; oz. 45c;
 $\frac{1}{4}$ lb. \$1.30; $\frac{1}{2}$ lb. \$2.40; lb. \$4.35.

Brussels Sprouts 108 Danish Prize (125 days)

The most delicately flavored vegetable of the entire Cabbage family. Plants grow medium tall and produce an abundance of large, solid, dark green, tightly folded "sprouts" or little Cabbage-like heads along the stem. Grow in moderately rich soil. Sow seed in April. Transplant in rows 3 ft. apart and 18 in. apart in the row. When the "sprouts" begin to form at the base of the stalk, break off the lower leaves to give them more room for growth.

A packet produces about 250 plants; one ounce, 3,000 plants; 2 to 3 ounces for an acre. Pkt. 10c; oz. 25c; $\frac{1}{4}$ lb. 70c;
 $\frac{1}{2}$ lb. \$1.10; lb. \$1.85.

Burpee's Danish Prize Brussels Sprouts

106 Propageno (80 days) ✱

Earliest and Largest; Italian Sprouting

An improved early strain of green sprouting Broccoli having a large, main head made up of an abundance of tender sprouts, and which after being cut will produce for a long time many smaller heads. Flavor is delicate and delicious. Make a generous planting so as to have a good supply of this wonderful vegetable all summer and fall. Propageno is earlier than Calabrese, produces larger heads, and is more productive. Vigorous, stocky plants, tall and erect. Thrives in sections where Cauliflower does not.

Pkt. 10c; $\frac{1}{2}$ oz. 25c; oz. 40c; $\frac{1}{4}$ lb. \$1.20;
 $\frac{1}{2}$ lb. \$2.20; lb. \$4.00.

Propageno Sprouting Broccoli

Bush Lima Beans

Culture: Lima Beans grow best on rich, well-drained, porous soil. As seed is sensitive to cold and wet, do not plant until all danger of frost is over; wait until the soil is warm and moderately dry, which is usually about the middle of May in the vicinity of Philadelphia. In most sections Limas are planted about 2 weeks after the first planting of Bush or Snap Beans. Plant in drills 2 to 3 ft. apart, spacing the seed 6 in. apart, and set them edgewise with the eye downward and cover with 2 in. of soil. Later thin to stand 18 to 24 in. apart in the rows. Cultivate shallow and frequently until the plants blossom. Pick the pods as soon as the beans are of edible size. A packet will plant about 25 ft. of row; 1 lb., 100 ft.; use 60 lbs. to an acre.

60 IMPROVED FORDHOOK BUSH LIMA (75 days) *

Larger and Thicker Pods than Fordhook Bush

The strong and erect, bushy plants produce a heavy growth of dark green foliage, which protects the blossoms and pods from direct sunlight. The sturdy, vigorous plants, 24 to 30 in. in height, spread out nearly 2 ft. and stand up well against wind and rains. Begins bearing very early and continues to produce until frost. Because of its earliness, and long bearing season, it is very popular, especially in sections where summers are comparatively short.

Bush Beans—Yellow-Pod

Culture: The same planting information given for Green-Pod Bush Beans (page 8) applies to the Yellow-Pod varieties as well. Beans are an indispensable part of every garden. Nearly everyone likes them; some prefer the green-pods; others the yellow or wax-pods, and many include some varieties of each in their plantings. Now that stringless, more tender and better flavored varieties have been developed, is it any wonder that Beans, especially the Dwarf or

Bush type, are rapidly gaining in popularity? Make succession plantings for a continuous supply. Have plenty for daily use and to can for winter. They have the best flavor when served or canned soon after picking—Beans from your own garden will be better than any you can buy. We offer the best varieties—selected from a long list after trying them out each year. Use insecticides listed in this seed book for the control of insect pests.

37 Pencil-Pod Black Wax (54 days) *

Golden Yellow Pods. Very Early and Most Productive

The beautiful, uniform, rich yellow pods grow 6 to 7 in. long, round as a pencil, meaty, and deeply saddle-backed. They are always solid, brittle, without fiber and entirely stringless. Plants are vigorous and heavily productive over a long period. Home gardeners and market growers are nearly all familiar with this popular bean. It is generally recognized as one of the really outstanding varieties of its class. This popularity is not due to any one characteristic of the variety but to a combination of many fine qualities. The first requirement of the average home gardener is for a bean of good quality with tender, stringless pods; earliness and hardness of growth might also be considered. All of these qualities are found in Pencil-Pod Black Wax. The appearance of the pods is of great importance, as a ready sale depends on an attractive display. Here again Pencil-Pod fills the bill, as its gracefully curved pods will always draw attention. The seed, when ripe, is jet black.

The rich, golden yellow pods are very attractive, 4 to 5 in. long, nearly straight, flat, broad, brittle, stringless, of excellent quality and borne in the greatest profusion. Plants grow compactly and more erect than the old Golden Wax, bearing the pods well off the ground. The rust-resistant quality of this variety makes it especially desirable for early and late sowings either by home or market gardeners. The white seeds are mottled with fawn and magenta.

Maule's Pole Beans

Culture: Plant Pole Bean seed after all danger of frost is past and the soil warm and moderately dry. If poles are used for support, set them 4 ft. apart each way and place 6 to 8 Beans around each pole, and cover with 1 in. of soil. When plants are well started, thin to 3 or 4 plants to a pole. A packet is enough for 20 poles; 1 lb. for 100 poles, 30 lbs. to an acre. Pole Beans may also be planted along a fence or trellis, using 1 lb. to 250 ft. of row. Keep vines closely picked throughout the season if you wish to prolong their bearing.

43 KENTUCKY WONDER OR OLD HOMESTEAD (65 days) *

Most Popular of All Green-Podded Pole Beans for Home or Market

Ever since the introduction of this variety in 1877, it has been a favorite among the gardeners of this and many other countries. Its adaptability to varying soil and climatic conditions has, no doubt, been largely responsible for this remarkable popularity. The variety can also meet every other requirement for a high quality bean, and it fully merits the position which it has created for itself. The plants are sturdy in their growth and very productive. The pods, which are borne in clusters, are from 7 to 8 inches in length, nearly round, fleshy and tender. When young, they are entirely free from string or fiber, although small strings develop later in the season. These strings do not impair the quality of the pods, and they can be eaten until late in the season. The light brown seeds have a fine and distinctive flavor which makes them suitable for use as shell beans.

Maule's Pole Lima Beans

Culture: Pole Lima Beans prefer a warm, sandy loam soil, enriched with well-rotted stable manure. Do not plant until the ground is warm and moderately dry and the weather is quite settled. Set poles 4 ft. each way, and plant 4 to 6 Beans around each pole, placing them with the eye downward to encourage quick germination. Cover 2 in. deep. After the seedlings are well started, thin out leaving 2 strong plants to each pole. Cultiva e shallow and frequently. Use one packet to 10 poles; 1 lb. to 50 poles; 30 lbs. to an acre. Small plantings may be made along a fence or trellis, putting several Beans a foot apart, later thinning to one strong plant. Such plantings would require 1 lb. to about 100 ft. of row.

53 King of the Garden (88 days) *

The Home and Market Gardener's Favorite

Wherever Pole Lima Beans are known, King of the Garden is almost certain to be one of the most popular and widely grown varieties. The vines are very sturdy in their growth, climbing to a height of from 6 to 10 ft. and with a considerable spread of branches. The pods are from 5 to 7 in. in length and contain 5 or 6 large beans which are tender and of delicious flavor. Pods are borne close to the ground early in the season and higher up on the plant as the season progresses. Bearing will continue until frost has killed the vines. The continued popularity of King of the Garden, in spite of the competition offered by newer varieties, is really the only recommendation that should be needed to convince both home and market gardeners that it is a bean everyone should grow and one that can be grown with confidence. Our strain of King of the Garden has been carefully selected for uniformity, length of pod, earliness of maturity and hardiness. This selection, along with care in growing and harvesting, insures a satisfactory crop for our customers.

A Maule Specialty. Uniform, Deep Red Beets; Extra Select

Our strain has been carefully selected and improved each year. It is noted for its purity and merit. Thousands of market growers and home gardeners have grown it to their profit and entire satisfaction, and consider our enthusiasm mild in comparison to the outstanding features of this Beet. It is an early variety with rich, dark red skin and short tops. The uniformity in size and shape is truly remarkable. They are perfectly globe-shaped and always smooth. The flesh is deep red with hardly any zone. It retains the deep red color when cooked. The flesh is solid, tender, and most agreeably sweet. May be grown for use in early spring, summer or fall; splendid for winter storing or for canning. Because of its quickness of growth, it is especially suited for late sowings; in fact, anyone wanting an all-season table Beet, should sow Maule's Blood Turnip. Get your seeds from Maule.

Early Maturing, Sweet, Dark Red Flesh; Popular

No other Beet can replace this well-established variety for earliness. Under favorable conditions the roots grow quickly and reach full size in an astonishingly short time. A favorite with market growers who plant it extensively for forcing to supply the early market. As the roots are of medium size and have only a limited amount of foliage, they can stand quite close planting. Its quality, attractiveness, uniformity, and the dark red color of the flesh are characteristics that will appeal to many gardeners. 70 Maule's Early Wonder (55 days)

Also Known as Boston Crosby. Early, Tender, Sweet

Early Wonder is the result of yearly selections made over a long period of time to perfect an early small Beet that would be considered the standard of excellence for all purposes. As we offer it today it seems almost impossible to still further improve its appearance and excellent quality. It is the earliest of the small table Beets for outside growing. Roots are flat to globe in shape, beautiful deep red, and have small tap-roots and medium sized tops. It is possible to grow them quite close and thereby increase the yield. It may be sown early; it matures early and so uniform in growth that the harvesting of the entire crop can be practically done at one time thereby permitting the use of the ground for some other planting. Equally desirable for home and market garden.

Maule's Quality Cauliflower

Culture: For early Cauliflower, start the seed of the early, quick maturing varieties indoors or under glass during February or March. When soil has become warm, transplant seedlings to the garden. For a main crop to cut during the summer and autumn, sow seed in May or early June in a specially prepared seedbed or frame; transplant seedlings to garden in late June or early July, setting the plants 2 ft. apart in rows 3 ft. apart. A packet will produce about 150 plants, an ounce about 3,000 plants. Four ounces are required to produce enough plants for an acre.

170 Super Snowball (90 days) *

Snow White

One of the earliest Cauliflowers and remarkable for its uniformity of size, shape and type. Under favorable growing conditions and good soil, best results are to be had. It heads so evenly that often the entire crop may be harvested within a short time after it begins to mature. Plants are vigorous; leaves are erect, quite large and curl over the heads so as to protect them from the sun. The large heads are pure white, solid, and very firm. In most sections, the best heads are raised from seed sown about the middle of May and plants set out in late June or July; this allows the plants to make their growth during cool weather which is the best for raising good Cauliflower.

*Extra Early, the Largest and Most
Uniform Header*

Maule's Prize Earliest has long been considered the finest, largest, most attractive extra early Cauliflower. Such close planting naturally means a greatly increased yield from a given space of ground. The compact perfectly white, closely formed heads are most attractive and are sure to bring a high price in the market. Maule's Crisp Celery

Culture: For earliest Celery, sow the seed thinly in the house or hotbed in February or early March. For a late crop for fall use or winter storing, sow the seed in frames or a specially prepared seedbed in the open ground as early in the spring as the soil can be worked up into a loose condition. Cover seed with no more than 1/4 in. of fine soil. Keep evenly and moderately moist until the seeds sprout which usually requires two weeks. Set plants 6 to 8 in. apart in single rows 4 ft. apart or double rows 1 ft. apart, allowing 4 ft. of space between each double row. Celery requires rich, well-manured soil and plenty of moisture for best results. It does especially good on muck soil. A packet of seed will provide about 400 plants; one oz. about 7,500 plants. Four ounces of seed are needed for an acre.

White Sweet Corn—continued

205 Maule's Colossal Early (88 days) *

The Finest Large-Eared Early White Sugar Corn In Existence

When sales of a variety of Sweet Corn continue to increase every year, as has been the case with Maule's Colossal Early since being introduced 24 years ago, it simply must be good. While Colossal Early averages 88 days to maturity, many gardeners in different sections have written us that it has produced its first ears within 78 to 80 days after planting. Quality in Sweet Corn is, however, more important for its popularity than season of maturity. Ears are 7 to 9 in. long and frequently 2 to 3 in. thick with 12 or 14 rows of large, white kernels of remarkable sweetness. Stalks grow 6 to 7 ft. tall, many of them carrying 2 to 3 ears each. If you grow any Corn, be sure to give Colossal Early a trial.

212 Maule's XX Sugar (82 days)

True Sugary Flavor

One of our great specialties and ever since we introduced it, we have carefully guarded its outstanding qualities. We have spent a great deal of time and money to assure growers of getting, year after year, a Corn of the same high quality as when first introduced. Even after it has passed its prime, it is still as sweet and tender as many other varieties when they are at their height of perfection. Stalks grow 5 to 6 ft. high; ears grow 7 to 9 in. in length with 12 to 16 rows of the most sugary kernels you ever ate. Excellent for home or market.

222 Maule's "Lead All" Evergreen (95 days) *

Extra Large Sized Ears of Superb Quality

In introducing this Corn some years ago, we realized that increased size linked with superior quality were most important features that would appeal to home gardeners and market growers. Maule's "Lead All" Evergreen combines extra-large size with the superb quality found in other Sweet Corns of the Evergreen type. It produces truly handsome ears which are sweeter and larger than either Country Gentleman or Stowell's Evergreen. The stalks grow 8 to 9 ft. tall, an indication of their vigorous habit and productiveness. Most of the plants produce two fine, well-developed ears measuring anywhere from 8 to 10 in. in length. They are thick and heavy, closely set with 14 to 16 rows of large, white, sweet grains. Noted for its drought-resistant qualities. Retains its fine flavor longer than most other varieties.

216 Country Gentleman (95 days) *

Long Slender White Grains of Unusual Sweetness

Easily recognized by the irregular arrangement of the kernels on the cob. Seeds, when dry, are long and narrow, hence the appropriate common name of *Shoe Peg* by which it is largely known. Ears are quite large, 7 to 8 in. long, with a small white cob thickly covered with long, slender, white grains of exceptional sweetness, and it remains "in the milk" for a very long time. Has become famous all over the United States for its nectar-like sweetness; and is the joy of epicures everywhere. Stalks grow 7 ft. tall and often carry as many as three ears each which makes it an unusually heavy yielder. Splendid late or main-crop Corn for home, market and canning.

345 New York or Wonderful (75 days)

Heat Resistant, Sure Cropper, Reliable Header

A widely used Lettuce, commonly called Iceberg or Los Angeles by growers and shippers on the Pacific Coast. It is, however, widely different from the original Iceberg offered on this page. New York or Wonderful has been well described as "the king of main-crop head Lettuces." The solid, compact heads, well grown in rich soil, often measure nearly a foot across and weigh heavily; outer leaves are deep green, heart blanches to a beautiful pure white, tasty, crisp and of delicious flavor. Plants are deep rooting so are quite resistant to heat; does best in spring and fall but for main summer crop, it has no equal. We do not recommend it for forcing. Valuable for home or market gardener.

Pkt. 10c; oz. 20c; ¼ lb. 50c; ½ lb. 80c; lb. \$1.35; 2 lbs. \$2.50; 5 lbs. \$5.95.

329 New York No. 515 (72 days) *

The Earliest Heading Lettuce of the New York or Wonderful Type

New York No. 515 is a little earlier than New York No. 12 which it resembles in general appearance. The large heads are solid, bright green in color, bleach to a beautiful white; always crisp, juicy and sweet. New York No. 515 has been bred for resistance to tipburn and will stand hot weather better than others of the New York type. It also makes wonderful heads in the fall from late summer sowings. Should you have had difficulty in raising head Lettuce in your garden, we would suggest trying this new, sure heading strain, of New York or commonly called "Iceberg" by shippers.

Pkt. 10c; oz. 25c; ¼ lb. 75c; ½ lb. \$1.15; lb. \$2.00; 2 lbs. \$3.70; 5 lbs. \$9.00.

323 Iceberg—The Original (60 days)

Very Popular for Home Garden; Exceptionally Crisp and Tender

The original Iceberg as offered here makes large, handsome heads of light green curled leaves with reddish tinged edges; hearts are crisp, tender, silvery white and of good quality. 343 Romaine or Cos Lettuce (68 days)

Distinct Type, Crisp, Tender and Sweet

Sometimes called Celery Lettuce because of its upright growth, the long, tender light green leaves enclosing a well-blanched, elongated heart. This Cos Lettuce is self-closing so that it does not need tying up in order to blanch the center leaves or heart which have a refreshing, snappy flavor. It will stand more hot summer weather than other Lettuces.

341 Chicken Lettuce (40 days)

Poultry and Rabbits Eat It Greedily

This Lettuce will yield more food for your poultry or rabbits than any other plant you could sow for "greens." It is ready to cut in about 40 days after sowing, and after cutting, the stumps will start out again to make new shoots so that in a short while you will have another crop ready for feeding. If not cut, plants will grow 4 ft. tall before going to seed.

Onion Sets

Onion Sets

Small Clean Sets, Vigorous, and of Choicest Quality

Culture: Onion Sets should be planted as early in the spring as the ground can be worked. Make furrows about 1 in. deep and press the Onions into the surface lightly but do not cover; have the rows 12 to 18 in. apart and set the Onions about 2 in. apart in the row. Green Onions may be had in a few weeks. In the vicinity of Philadelphia, Onions large enough to cook are ready in early July, but if large, ripe Onions are wanted, it is usually about the middle of July before they can be harvested. By planting sets, Onions can be produced for market or household use four to six weeks earlier than can be had from seed. A pound of Onion Sets will plant a row about 100 ft. long. Use 250 to 325 lbs. to an acre. The early lifting of an Onion crop allows for the sowings of quick maturing crops on the same ground the same season.

Maule's Onions

Culture: Sow seed in rows, 12 to 18 in. apart, as early in the spring as the soil can be worked into a good, loose condition; cover seed $\frac{1}{2}$ in. deep. If sets are wanted, sow seed thickly and do not thin out; use 60 to 80 lbs. of seed per acre. If ripe Onions are wanted, sow seed thinly and when young plants are a few inches tall, thin out to stand about 3 to 5 in. apart in the row. A packet will sow about 50 ft. of row, an ounce about 200 ft.; 4 to 5 lbs. of seed per acre. MAULE'S QUAL

Fresh young Peas, picked from the vines and cooked as soon as possible thereafter, are one of the most delicious vegetables. Early maturing Peas are divided into two groups—the ripened seeds of one are smooth while the others are wrinkled. Seed of the harder smooth-seeded varieties should be sown as early in the spring as the ground can be worked. Wrinkled-seeded varieties are more susceptible to cold weather so the seed should not be sown until all danger of frost has passed. By planting some of the early, medium and late varieties at the same time, a continuous supply of fresh Peas may be enjoyed for a long time. Successive sowings of each variety may be made every 10 days until May 10. Sow again late in August for a fall crop. Space the rows 2 to 2½ ft. apart for dwarf varieties; 2½ to 3 ft. apart for tall varieties. Cover the seed 1 to 2 in. deep. A packet will sow about 20 ft. of row; a pound 100 ft.; 120 lbs. of seed are needed to sow one acre. Varieties growing more than 2 ft. tall do better if staked up or otherwise supported.

Smooth-Seeded Early Peas

Especially valuable because seed can be planted as early in the spring as ground can be prepared.

MAULE'S QUALITY GARDEN PEAS

Fresh young Peas, picked from the vines and cooked as soon as possible thereafter, are one of the most delicious vegetables. Early maturing Peas are divided into two groups—the ripened seeds of one are smooth while the others are wrinkled. Seed of the hardier smooth-seeded varieties should be sown as early in the spring as the ground can be worked. Wrinkled-seeded varieties are more susceptible to cold weather so the seed should not be sown until all danger of frost has passed. By planting some of the early, medium and late varieties at the same time, a continuous supply of fresh Peas may be enjoyed for a long time. Successive sowings of each variety may be made every 10 days until May 10. Sow again late in August for a fall crop. Space the rows 2 to 2½ ft. apart for dwarf varieties; 2½ to 3 ft. apart for tall varieties. Cover the seed 1 to 2 in. deep. A packet will sow about 20 ft. of row; a pound 100 ft.; 120 lbs. of seed are needed to sow one acre. Varieties growing more than 2 ft. tall do better if staked up or otherwise supported.

Smooth-Seeded Early Peas

Especially valuable because seed can be planted as early in the spring as ground can be prepared.

Another good point which will commend "Straightneck" to all housewives is that it is so much easier to prepare for cooking. Flesh is salmon-yellow, and of the finest quality; skin is golden orange and heavily warted. Fruits are about 18 in. long. Just as early as "Crookneck." Plants are bushy, vigorous and very productive.

Culture: Winter Squashes require the same general cultural directions as the summer varieties but need a longer growing season to mature. Fruits must remain on the vine until they have fully matured; gather them before frost, leaving part of the stem attached. Keep in a moderately warm, dry place until used. Handle carefully so as not to bruise them, for bruises may cause decay. Examine fruits in storage from time to time. Many of the Winter Squashes make excellent "pumpkin" pie. A New and Interesting Novelty

The beautiful long, light green fruits should be eaten when young. They will grow to an astounding length, often 5 ft. Maule's Tomatoes

Culture: Sow seeds in a hotbed, greenhouse or in shallow boxes in the house, 6 or 7 weeks before the usual time in your locality for setting out the plants. Make sowings in rows 4 to 6 in. apart and cover seed $\frac{1}{2}$ in. deep. When the plants are about 2 in. high, transplant singly to 3-inch pots or into shallow boxes 4 in. apart each way. Transplant in the open ground, after all danger of frost is past, 3 to 4 ft. apart each way. Cultivate frequently. A packet will produce about 300 plants, an oz. about 2,500 plants, 2 oz. produces enough plants for an acre.

669 MARGLOBE (100 days) *

The Popular Wilt and Rust-Resistant Tomato

Few Tomatoes have become as popular in such a short time as Marglobe. It is an introduction of the U. S. Department of Agriculture, Washington, D. C., and has been received with great enthusiasm by tomato growers throughout the country. Marglobe Tomato can only be described in one word and that is "Perfection." Its habit of growth is decidedly spreading, and it bears large, smooth, globe-shaped meaty deep red fruits in great abundance. Its shape, beautiful scarlet color, and its eating qualities cause it to be given first place wherever grown—for home, market or shipping. If you have been troubled with wilt or rust in growing Tomatoes, you should certainly grow this variety; growers in all sections where Marglobe has been grown, report enormous production.

651 Maule's Earliest of All (86 days) *

The Greatest of All Early Tomatoes. Four Days to a Week Earlier Than Any Other

Maule's Earliest of All is the best red Tomato for home gardens and market. Its extreme earliness is not its only merit for the fruits are large, rich in color, and extremely meaty. They do not crack, neither do they have a hard core. While they are a trifle irregular in shape, they are not rough. When we say that it is the earliest Tomato, we are fully aware of the claims made for June Pink, Earliana, and others. If you have not given this wonderful Tomato a trial, you will neglect your own interests if you do not include it in your order.

Maule's Famous Lawn Grass Seed

891 "EXTRA QUALITY" Best General Mixture

Low Growing Evergreen Grass

This mixture is the result of years of experiment and study and is unsurpassed for producing a velvety green deep-rooted sod that will be permanent and present a good appearance spring, summer and fall. It is made up of grasses that are at their best at different periods and thus a lasting and permanent effect is obtained. It is entirely free from grasses that form clumps. A small proportion of White Dutch Clover has been included in the mixture because it thickens the sod and grows well with the finer grasses.

For Under Trees or Shady Nooks

Nothing spoils the good effect of a lawn more than bare spots in shaded corners, or under trees. Using this grass mixture will help you to do away with these unsightly spots as the grasses in this mixture are naturally adapted for growing in semi-shaded positions. Proper preparation of the soil, an ample supply of plant food, and regular watering may be needed if rain does not reach the shaded spots in abundance.

MAULE'S BEAUTIFUL ASTERS

With its many and varied forms, its wide range of color, and its real beauty, the Aster is deservedly one of the most popular flowers we have. By planting early, midseason and late varieties you may have Asters from June to frost. **W. R.** means Wilt-Resistant—resistant to the destructive Wilt disease. We offer all that have been bred so far, and will add more as they are developed.

Asters bloom from three to five months after seed is sown, varying with the variety and the climate. By starting the seed indoors, 6 weeks before outdoor planting time, earlier blooms may be had. Give your Asters rich, well-drained soil, plenty of moisture and sunshine, and they will repay you. The location of the Aster bed should be changed every year.

SNAPDRAGONS

For color in the garden, or grown commercially by florists in greenhouses during the winter, or as cut flowers, Snapdragons have been universal favorites for years. The introduction of new and varied types has made them more popular than ever. All are easily grown in ordinary, well-drained garden soil in either full sun or semi-shade. Flowers are freely produced for several months and until frost where conditions are favorable. For earliest blooms sow seed indoors about six weeks before your regular outdoor planting time; for later flowers sow outdoors in the spring when the soil has become quite warm.
